Project Details

Project Title: AI Powered Applicant Tracking System for University of the South Pacific

Project team:

Name	Role
Anav Chand	Architect & Cloud Engineer
Vishant Kumar	Full-stack Developer
James Kado	Full-stack Developer
Rohan Nandan	AI/ML Engineer & QA Engineer
Dipika Narayan	Full-stack Developer & QA Engineer

Definitions and Acronyms

Applicant Tracking System (ATS)	Software that helps manage job postings and applications for a company.
Minimum Viable Product (MVP)	The simplest working version of the system, which only has the core features.
CRUD (Create, Read, Update, Delete)	Basic operations performed on data in response to business logic.
Application Programming Interface (API)	A way for systems to communicate with each other and exchange data.
Entra ID	An identity and access management service provided by Microsoft Azure.
HTTPS	A secure protocol used by a browser to communicate with a website.
Serverless	A cloud computing model where code runs on short lived functions (no servers).
Asynchronous Processing	Completing a task in the background instead of making the user wait.
Scrum	A way of managing a project in short cycles called Sprints.

Project Description

Client and the Current System

The University of the South Pacific (USP) is a higher education institution based in the Pacific region. Being the only university of its type, USP, is governed by 12 Pacific Island countries and currently has 14 campuses spread across the 12 Pacific Island member countries, with the main campus, Laucala, being in Suva, Fiji ("About the University," n.d.). Having such vast number of campuses spread across multiple countries requires USP to continuously hire people to work in its various departments in order for it to perform its day-to-day operations successfully, especially teaching and learning.

The University of the South Pacific also hires students who are almost in near completion of their studies to work as teaching assistants or peer mentors for the various courses that the university offers as part of providing these students with opportunities to gain work experience. The current hiring system at USP requires applicants to submit an online application via its careers portal, along with uploading various documents such as a cover letter, resume and certified academic transcripts and successful candidates are contacted after a 6-week recruitment process. (Frequently Asked Questions (FAQs) - USP Staff, 2020).

Current Issues

While the current system at USP does offer online submission of applications, it also brings about certain issues. These issues include portal inefficiencies, resulting in applicants not being able to track the status of their application, limited file size on uploads, whereby applicants are not able to upload files with a large size and may need to compress certain documents in order to upload it, and a long waiting period before any feedback is sent to the applicants. This results in applicants having no knowledge about the results of their application until the very end of the recruitment process. In addition to this, students can also miss out on job listings, and it may also be difficult to track certain listings. Moreover, The University of the South Pacific has also implemented a community-based announcement platform called the "Tukutuku" update. While this platform serves as a means in which students get to know about job postings by USP, announcements are often missed and can get lost in the mail.

Proposed System

The proposed system that will help mitigate the issues being faced with the current system at USP is an AI Powered Applicant Tracking System (ATS) for job postings by the University of the South Pacific. The Applicant Tracking System will be a web-based application will be developed with modern technology and would allow students to create a user profile, apply for listed jobs, and track the status of their applications, all in just one platform,

while it will also allow administrators to post available jobs and view applications along with applicant details for further evaluation.

The key feature that makes this system unique is an integrated AI powered recommendation system that will compare an applicant's user profile and cover letter in order to produce a fitting score together with its reasoning. This feature will assist admins in shortlisting the best candidate(s) for a particular listed job in a timely manner without having to review every single application in the system. Additionally, the proposed system will also offer various functionalities such as user profile management, job posting management, job feed with search and filter and application submission and tracking. The development methodology of this system would be based on the scrum methodology.

Complex Computing

Decoupling AI scoring functionality from a request/response cycle via Trigger.dev . When a job application is created, it triggers the AI processing in the background and immediately notifies the user that the application was successful. The scoring process will finish at a later time and update the database with the applicants' score. HTTP polling is used to handle pending/failed states for this background AI process on the UI. Moreover, the web app and AI scoring worker run as separate processes across different physical servers.

Business Benefits

Tangible Benefits

- Faster hiring time – The system will form a workflow automation whereby candidates will move along the workflow pipeline based on certain triggers. For instance, automated emails being sent to candidates who have been shortlisted for an interview (Benefits of an Applicant Tracking System: What the Data Shows, 2025).
- Improved Candidate Matching and Hire Quality – The integrated AI powered recommendation system within the application will help in identifying and ranking all the candidates based on the most fitting score by comparing the candidate's profile and cover letter against the job listed. This will allow the admin to identify the most suitable candidate for a particular job, resulting in a highly improved hire quality (Benefits of an Applicant Tracking System: What the Data Shows, 2025).
- Reduction in Data Loss – The applicant tracking system will allow for a single source of candidate information whereby the various admins will be able to see the same candidate data, application information, and the current status of the application. This will prevent candidate applications and data from being lost when there is change in admin roles or when the admin leaves the organization as this normally occurs when information is present across emails, and hiring notes (SJ Niderost, 2026).

- Reduction in Manual Data Entry – The proposed system will automatically extract the applicant's data from their respective user profiles for evaluation and comparison purposes rather than a manual entry of such data into the system, and this information may include applicant name, contact details, address and other relevant details (SJ Niderost, 2026).

Intangible Benefits

- Enhanced Employer Branding – The Applicant Tracking System will provide a responsive and smooth application process that will create a sense of employer professionalism, which will result in overall enhancing the institution branding and attracting new and dynamic employees (Benefits of an Applicant Tracking System: What the Data Shows, 2025).
- Enhanced Communication – The job hiring process can become highly comprehensive, resulting in slow responses to applicants which can ultimately cause the loss of a top candidate. The proposed system will offer an improved communication channel between recruiters and applicants so that timely communication is maintained in order to prevent loss of candidates (What Is an Applicant Tracking System ?, 2019).
- Improved Compliance – The system will offer highly improved compliance to modern hiring practices by offering automated data deletion and secure storage of applicant data ensuring that the institution is protected and compliant while creating a sense of confidence within the applicants (Holdroyd, 2025).
- AI Driven Data Insights – The proposed Applicant Tracking system for the University of the South Pacific will provide AI-driven data insights on the dashboard via the use of the AI-based recommendation scoring system. This will provide valuable insights such as time-to-hire and cost-per-hire immediately for decision making.

Stakeholders

Stakeholders are individuals or groups who are involved in, affected by, or have an interest in the successful development and implementation of the AI-Powered Applicant Tracking System (ATS). They are categorized into internal stakeholders and external stakeholders.

Internal Stakeholders

Internal stakeholders are individuals and groups within the University of the South Pacific who are directly involved in the development, management, and daily use of the system.

Students and Staff

Students and staff of USP are the primary end users of the Applicant Tracking System as they will use the platform to manage their profiles, browse available job opportunities, submit applications, upload cover letters, and track the status of their applications.

Human Resources / Recruitment Team

The HR (recruitment) team manages job vacancies and recruitment through the system. They create and publish job postings, evaluate applicants using submitted documents and AI-generated recommendations, update application statuses, and communicate recruitment outcomes to users. Department representatives review applications, shortlist suitable candidates, conduct interviews where necessary, and make final hiring decisions.

System Administrators

System administrators maintain the Applicant Tracking System by managing user accounts, monitoring system performance, ensuring data security, maintaining the database, resolving technical issues, and keeping the system available and reliable.

Project Development Team

The development team consists of the student developers responsible for planning, designing, implementing, testing, and deploying the ATS, while ensuring that it meets user requirements, integrates AI functionality, and delivers a secure and user-friendly solution.

External Stakeholders

External stakeholders are individuals, organizations, or services outside the immediate management of the University that contribute to or are affected by the system.

Third Party Vendors

This includes the entities that provide the technology and services required to support the operation of the Applicant Tracking System. Although they are not directly involved in the recruitment process, their services are essential to ensure the system performs efficiently.

Regional Government (USP Member Countries)

The regional governments of the member countries have an interest in initiatives that improve higher education, digital transformation, and student employability. The ATS supports these goals by making student job opportunities more accessible and recruitment more efficient.

Prospective Students and their Families

The availability of an organized platform can positively influence the prospective students' family' perception of USP. A system that provides easy access to on-campus employment opportunities demonstrates the universities' commitment to supporting students financially and academically, making USP a more attractive choice for future students.

System Scope

High level user and system requirements

User Requirements	System Requirements
1. Members and administrators shall be able to securely access the Applicant Tracking System using their USP accounts and access functions appropriate to their assigned role	1.1 The system shall authenticate members and administrators through USP Microsoft Entra ID. 1.2 The system shall identify the authenticated user's assigned role as either Member or Administrator. 1.3 The system shall provide members with access to member-specific functions after successful authentication. 1.4 The system shall restrict administrator functions and routes to users assigned to the Administrator role. 1.5 Unauthenticated users shall be prevented from accessing protected system functions.
2. Members shall be able to create and maintain a profile containing information required for job applications and applicant evaluation.	2.1 The system shall require a member to create a profile following their first successful login. 2.2 The profile shall support personal information, education history, degree or programme, GPA, technical and soft skills, certifications, and personal projects. 2.3 The system shall store each profile against the corresponding member account. 2.4 Members shall be able to modify their stored profile information when necessary. 2.5 The system shall use the member's stored profile information when processing job applications and AI recommendations.

3. Members shall be able to browse, search, filter and view available USP job opportunities.	3.1 The system shall display active job postings available to members. 3.2 Each job posting shall display its title, description, department, campus, job type, requirements, working hours and application deadline. 3.3 The system shall allow members to search for job postings using job titles or keywords. 3.4 The system shall allow job postings to be filtered by campus, job type and minimum GPA requirement. 3.5 Archived or deleted job postings shall not be displayed in the active job feed.
4. Administrators shall be able to create and manage job postings available through the Applicant Tracking System.	4.1 The system shall allow administrators to create a new job posting. 4.2 Each job posting shall contain a title, description, department, campus, job type, requirements, working hours and application deadline. 4.3 The system shall allow administrators to modify existing job postings. 4.4 Changes made to a job posting shall not alter applications that were submitted before the changes were made. 4.5 The system shall allow a job posting with no existing applications to be permanently deleted. 4.6 A job posting containing one or more applications shall be archived rather than permanently deleted.

5. Members shall be able to apply for available jobs and monitor the progress of their submitted applications.	5.1 The system shall allow members to submit an application for an active job posting using their stored profile information. 5.2 A cover letter shall be required before an application can be successfully submitted. 5.3 Each submitted application shall be associated with the relevant member and job posting. 5.4 The system shall prevent a member from submitting more than one application for the same job posting. 5.5 Members shall be able to view their submitted applications and their current application status. 5.6 Application status shall be represented as Submitted, Shortlisted, Accepted or Declined. 5.7 Members shall be able to withdraw an application before a final recruitment decision has been made.
6. Administrators shall be able to review applicants for each job posting and manage the progress of their applications.	6.1 The system shall display all applications submitted for a selected job posting. 6.2 Administrators shall be able to access the relevant member profile, cover letter and application information for each applicant. 6.3 The system shall allow administrators to change an application's status to Shortlisted, Accepted or Declined. 6.4 Changes to an application's status shall be reflected in the corresponding member's application tracking information. 6.5 Applications associated with archived job postings shall remain accessible to authorized administrators.

7. Administrators shall be provided with AI-assisted applicant recommendations to support the evaluation and ranking of applicants.	7.1 The system shall generate an AI fit score for each submitted application. 7.2 The AI recommendation shall evaluate relevant member profile information, education, skills, cover letter content and job requirements. 7.3 The system shall provide supporting reasoning with each AI-generated fit score. 7.4 Applicants for a job posting shall be presented to administrators according to their AI-generated fit scores. 7.5 AI-generated scores and reasoning shall only be accessible to authorized administrators. 7.6 AI-generated recommendations shall provide decision-support information and shall not automatically accept, reject or shortlist an applicant.
---	--

System Architecture

This system will make use of layered, event-driven architecture, running on serverless infrastructure optimized for resilient processing of AI tasks. The technology stack and deployment platforms include the following:

- **Authentication layer:** user sign-in is handled via better-auth integrated with Entra ID (Microsoft Azure) as the identity provider, ensuring, role-based access to internal users.
- **Presentation layer:** the user interface will be developed using Next JS (React JS and Hero UI) and deployed onto the Vercel global edge network for fast load times.
- **Application layer:** serverless API endpoints made within Next JS will handle the core business logic (CRUD operations), which will be hosted on Vercel alongside the UI.
- **Data layer:** a relational database powered by PostgreSQL hosted on Neon and accessed via Prisma ORM will act as the central source of all application data.
- **Asynchronous processing layer:** a Node JS queue and worker hosted on Trigger.dev will be used to handle all AI processing tasks in an asynchronous manner.
- **Artificial Intelligence layer:** the Gemini API offered by Google will be used to run inference on applications to provide AI scores and reasoning.

Schedule and Deliverables

Gantt Chart

The duration of the project is 65 days. Notable public holidays: 24th August, Prophet Mohammed's Day. The starting date of the project is the 28th of July 2026 with the project concluding on the 27th of October 2026. [Gantt Chart](#).

Activity Table

Activity	Activity Name	Optimistic	Most Likely	Pessimistic	Estimated Duration	Predecessors
A	Project Initiation and Scrum Setup	4	5	6	5	—
B	Requirements Gathering and Project Proposal Brainstorming	8	10	12	10	A
C	Setup Authentication with Microsoft Entra ID	4	5	6	5	A
D	Begin Core Development on Profile Management Module	4	5	6	5	C
E	Systems Requirements Specification Development	4	5	6	5	B
F	Implement Job Posting and Job Feed Modules	7	10	13	10	C
G	Prototype Integration and Client Demo	4	5	6	5	D, E, F
H	Application Tracking and AI Scoring Development	8	10	12	10	G

K	System Integration and Hardening	4	5	6	5	J
L	Testing, Metrics, and User Manual Development	4	5	6	5	K
M	Final Demonstration Preparation	4	5	6	5	L

Work Breakdown Structure

WBS Dictionary

Level	Code	Element name	Definition
1	1.0	USP AI-Powered ATS Implementation	Complete 12-week program to design, develop, test, and deliver an AI-powered Applicant Tracking System for USP, covering student profiles, job postings, applications, and AI-driven fit scoring.
2	1.1	Sprint 1 - Initiation, Requirements & Development Start	Project is formally started, scope and requirements confirmed with the client, the Scrum team assembled, and initial development begun across all five modules.
3	1.1.1	Project Initiation and Scrum Setup	Assemble the project team, assign Scrum roles, configure the development environment, and produce a prioritized product backlog ready for Sprint 1 planning.
3	1.1.2	Requirements gathering and Project Proposal Brainstorming	Gather requirements from the client and end users across all five modules and produce the Project Proposal covering scope, architecture, timeline, and risk.
3	Milestone	Project Proposal Approved	The client reviews and signs off on the Project Proposal.
3	1.1.3	Setup Authentication with Microsoft Entra ID	Configure Microsoft Entra ID as the identity provider for login and role-based access between admin and members
3	1.1.4	Begin core development on Profile management module	Design the core data model and authentication, then build a first-pass version of profile management.
2	1.2	Sprint 2 - Prototype & Design Documentation	A prototype is demonstrated to the client, expanded functionality across all modules, and Systems Analysis and Design Documentation is produced.
3	1.2.1	Systems Requirements Specification Development	Document functional and non-functional requirements for all five modules.
3	Milestone	SRS Submission	The Systems Requirements Specification is reviewed and confirmed with the client as a baseline for development.
3	1.2.2	Implement job posting and job feed modules	Build job posting, publish, close, and edit workflows, the admin dashboard and job feed search and filter.
3	1.2.3	Prototype Integration and Client Demo	Integrate all in-progress modules and a prototype AI scoring call into prototype to present to the client.
3	Milestone	Prototype Demo Delivered	The client reviews the integrated prototype of the core student and admin flows and provides feedback.
3	1.2.4	Application Tracking and AI Scoring Development	Build the AI scoring pipeline, including data preprocessing, prompt design, and setting up infrastructure and extend application tracking with notifications and division of process into multiple levels.

3	1.2.5	Systems Analysis and Design Documentation	Produce the entity-relationship diagram, system architecture diagram, sequence diagrams, and data flow diagrams describing the finished system.
3	Milestone	Design Documentation Submitted	The Systems Analysis and Design Documentation is reviewed and confirmed with the client.
2	1.3	Sprint 3 - Feature Completion & Hardening	Remaining functionality is completed; the system is hardened and integrated, testing documentation and the Final Demonstration to the client.
3	1.3.1	AI Scoring Finalization and Job Application Completion	Finalize the AI scoring service, evaluate scoring accuracy, and complete remaining job application tracking dashboard and notification features.
3	1.3.2	System Integration and Hardening	Conduct integration testing, accessibility and security review and performance tuning.
3	Milestone	Development Completion	All five modules are integrated, tested, and stable. Shift to verification and documentation.
3	1.3.3	Testing, Metrics, and User Manual Development	Compile Software Metrics and Testing Report and write the User Manual for students and administrators.
3	Milestone	Metrics and Testing Report and User Manual Delivered	The Software Metrics and Testing Report and User Manual are handed over to the client.
3	1.3.4	Final Demonstration Preparation	Deployment of final system, prepare demo data and build the client presentation.
3	Milestone	Final System Demonstration and Handover	The completed system is demonstrated live to the client and formally handed over.

Risk Management Plan

Risk Factors

Mitigation Strategies

1.0 Unrealistic Project Schedule

1.1 Risk Factors

- Underestimating the time required to develop system functionalities.
- Delays in completing assigned development tasks.
- Insufficient time for system integration and testing.

1.2 Mitigation Strategy

- Develop realistic project milestones and sprint deadlines.
- Monitor progress throughout each sprint and adjust workloads where necessary.
- Allocate sufficient time for system integration and testing.

2.0 Budget Constraints

2.1 Risk Factors

- Limited funds are available for project development.
- Costs associated with AI and cloud services such as Google Gemini, Vercel, Neon and Trigger.dev.
- Additional costs if free service limits are exceeded.

2.2 Mitigation Strategy

- Monitor project expenditure throughout development.
- Utilize free or educational service tiers where available.
- Monitor the usage of paid AI and cloud services to prevent unexpected costs.
- Prioritize essential system functionality if financial limitations arise.

3.0 Scope Creep / Changing Requirements

3.1 Risk Factors

- Introduction of new requirements after development has commenced.
- Additional functionality requested by USP stakeholders.
- Changes to previously agreed system requirements.
- Expansion of the system beyond the agreed project scope.

3.2 Mitigation Strategy

- Clearly define and document the agreed project scope.
- Review proposed changes with stakeholders before implementation.
- Assess and adjust project timelines where significant changes are approved.

4.0 Team Coordination Issues

4.1 Risk Factors

- Unequal distribution of workload among team members.
- Conflicting schedules affecting team collaboration.
- Poor communication resulting in delays or inconsistent development.

4.2 Mitigation Strategy

- Conduct regular Scrum meetings to review progress and address issues.
- Use GitHub Projects to monitor assigned tasks and progress.
- Maintain clear communication among team members.
- Redistribute tasks where workloads become unbalanced.

5.0 AI Recommendation Inaccuracies

5.1 Risk Factors

- Poor prompt design resulting in inaccurate AI recommendations.
- Insufficient applicant information affecting recommendation quality.
- Limitations of the AI model resulting in inconsistent scoring.
- Potential bias in AI-generated recommendations.

5.2 Mitigation Strategy

- Evaluate AI outputs using representative applicant information.
- Refine prompts based on testing results.
- Test AI recommendations for accuracy, consistency, and fairness.
- Require administrator review before recruitment decisions are made.

6.0 Data Security Breach

6.1 Risk Factors

- Unauthorized access to confidential applicant information.
- Incorrect configuration of authentication or access controls.
- Security vulnerabilities exposing member profiles and application information.

6.2 Mitigation Strategy

- Implement secure authentication through Entra ID and role-based access control.
- Encrypt sensitive information transmitted between users and the system.
- Conduct security testing to identify and address vulnerabilities.
- Restrict access to sensitive applicant information according to user roles.

7.0 Third-Party Service Failure

7.1 Risk Factors

- Outages affecting Google Gemini, Entra ID, Neon, Vercel or Trigger.dev.
- API failures interrupting authentication, AI scoring or other system functions.
- Dependency on external services outside the development team's control.
- Changes to third-party services or APIs affecting system integration.

7.2 Mitigation Strategy

- Monitor the availability of external services.
- Implement appropriate error handling and retry mechanisms.
- Maintain alternative procedures where critical external services become unavailable.

8.0 Database Failure or Data Loss

8.1 Risk Factors

- Accidental deletion or corruption of database records.
- Failure of database backup processes.
- Database or configuration failures resulting in the loss of system information.

8.2 Mitigation Strategy

- Perform regular automated database backups.
- Establish database recovery procedures.
- Periodically test data restoration processes.
- Restrict potentially destructive database operations to authorized users.

9.0 Legal Compliance

9.1 Risk Factors

- Failure to comply with relevant USP policies and data protection requirements.
- Improper handling or storage of personal applicant information.
- Unauthorized access to confidential applicant records.
- Retention or use of applicant information beyond its intended purpose.

9.2 Mitigation Strategy

- Ensure compliance with relevant USP policies and data protection requirements.
- Restrict access to applicant information according to assigned user roles.
- Review data handling practices throughout system development.

10.0 Ethical Use of Artificial Intelligence

10.1 Risk Factors

- AI recommendations unintentionally favoring or disadvantaging applicants.
- Lack of transparency in AI-generated recommendations.
- Over-reliance on AI recommendations when making recruitment decisions.

10.2 Mitigation Strategy

- Evaluate AI recommendations for fairness and consistency.
- Provide administrators with clear reasoning for AI-generated scores.
- Ensure AI recommendations support rather than replace human recruitment decisions.
- Review AI outputs for potential bias throughout testing.

Group Member Details

Name	Student ID
Anav Chand	S11221203
Vishant Kumar	S11230430
James Kado	S11200776
Rohan Nandan	S11234883
Dipika Narayan	S11231549

Team Purpose

The purpose of this team is to design, develop, and implement an AI-Powered Applicant Tracking System for the University of the South Pacific. The system aims to provide a centralized platform for students to search and apply for job opportunities, track their application status, and receive AI-powered recommendations based on their suitability for available positions. By applying the knowledge and skills gained throughout the software engineering programme, the team will work collaboratively to complete each phase of the project and deliver a secure, reliable, and user-friendly solution. All team members agree to contribute fairly, adhere to ethics, and work towards the successful completion of the project within the allocated project timeline.

Decision Making Policy

All decisions related to the project will be discussed collectively during team meetings. The final decision will consider the opinions and suggestions of every team member to ensure fairness and informed decision-making. Where possible, decisions will be made through mutual agreement (consensus). If a consensus cannot be reached, the team will decide by a majority vote. This approach promotes accountability and equal participation, helping the team achieve its overall goal of delivering a high-quality project on time.

Code of Conduct

The team has unanimously agreed to follow the following code of conduct throughout the project to ensure accountability, fairness, effective collaboration, and ethical conduct. The members are expected to fairly contribute and complete their assigned responsibilities, communicate respectfully, and maintain the confidentiality and integrity of the project information.

Ethics

	Purpose	Rule	Violation	Action
Meetings and Communication	To ensure effective communication and active participation among all users.	All members should attend scheduled meetings, participate in discussions, and communicate respectfully with the team.	Repeatedly missing meetings without valid reasons or failing to communicate with the team.	The group leader will discuss the issue with the members and provide a reminder. Repeated violations may be reported to the supervisor.
Roles and Workload	To ensure that project responsibilities are distributed fairly among all members.	Each member must complete their assigned tasks within the agreed deadlines and contribute fairly to the project.	Consistently failing to complete assigned tasks or placing an unfair workload on other members.	The team will discuss the issue with the member and agree on a suitable solution or revised deadline. Continued issues may be reported to the supervisor.
Confidentiality and Data Privacy	To protect sensitive information that may be used or discussed during the development of the Applicant Tracking System.	Team members must protect confidential project information and must not share personal, academic, or application-related information outside the project without authorization.	Sharing confidential student information, login credentials, application data, or other sensitive project information with unauthorized individuals.	Access to the relevant information or system may be restricted, and the incident will be reported to the group leader and supervisor. Appropriate corrective action will be taken based on the seriousness of the violation.
Evaluation and Accountability	To ensure that individual contributions and project progress are reported honestly and fairly.	Members must provide accurate progress updates and honestly report on their individual contributions.	Claiming another member's work as their own, providing false progress information, or deliberately misrepresenting their contribution.	The team will review available evidence. Confirmed issues may be reported to the supervisor.

Sign-off

- a) I participated in formulating the roles and procedures as stated in this contract.
- b) I understand that I am obligated to abide by these terms and conditions.
- c) I understand that if I do not abide by these terms and conditions, I will suffer the consequences as stated in this contract.

Mark Allocation

After our group discussion, we recommend the following mark allocation to each group member, based on level of contribution throughout the assignment.

Group Number: 4

Project Manager: Anav Chand

Name	Percentage of Final Points
Anav Chand	100%
Vishant Kumar	100%
James Kado	100%
Rohan Nandan	100%
Dipika Narayan	100%
