IS221 Assignment 1 – Website Design Proposal

1.0 Introduction

1.1 Mission

The mission in creating this site is to improve the services offered by the Indo-Pac Health Care. This website is a portal that allows people to interact and make a booking for themselves for their appointment. Not only people can make a booking for themselves using this website, but also can get health tips from the professionals. Patients can also get access to their medical past appointment history. This digital medical history is far better than a regular file in hospital as a hard copy file can get easily lost whereas a digital medical file is saved on the server. Patients can also get vital information about the Indo-Pac Health Care very easily. Through a feature known as Frequently Asked Questions (FAQs) patients can have their confusion about the Indo-Pac Health Care resolved. These include information about opening hours and many other vital information which will help the people in using this website with no difficulties. This information will make the website easy to use and will also make the Indo-Pac Health Care look more professional and organized which is how a health care clinic should be. The website will also provide a feature of review and feedback. This feature will allow the Indo-Pac Health Care to assess if the services provided are up to expectations or not and this will help them to improve as health care professionals.

1.2 Vision

By creating this website, this can improve the medical services provided in a country especially a developing country like Fiji. People tend to wait for hours in line just to be seen by the doctor. This website will increase patient satisfaction. Appointments reduce the waiting time of people. An online platform is much better than making an appointment via phone since many patients can make an appointment simultaneously. Making a booking online can be much faster than booking via phone since people can enter their details much faster than telling a person on phone. Moreover, patients can also make an appointment at any time of the day whereas regular appointment bookings in hospital can happen at a particular time of the day which limits patient's flexibility of making appointments.

1.3 Site Goals

The goal of the site is to allow the people to make an appointment for their medical clinic online. This will allow people to make their booking by themselves rather than relying on the medical staffs. This online booking system will also give the people some flexibility in choosing their appointment throughout the week. In addition to, this website will be

accessible to the patients 24/7 thus patients can book anytime which leads to high customer satisfaction. Usually when the medical staffs give the appointment, they just provide the date without giving the people a choice as to when they want the appointment to be made. They are not provided with options but this website will allow the patients to make an appointment by themselves with the freedom to choose.

1.4 Special Features to Make the Website Standout

Patients can see their medical reports and also gain information about their last clinical visit Patients can gain access to their medical history which is very useful since in Fiji, they still follow the old file system where a patient's medical history or file easily gets lost and thus faces problems. An online platform will ensure that the patient's medical history is kept safe and is never lost. Many patients can make an appointment simultaneously while using the website whereas booking an appointment via telephone can take significant amount of time as the patients will have to give many information before their appointment is made. This is a very efficient idea to also improve the health system of a developing country such as Fiji. Easy navigation of the website which allows patients to use this website easily and effectively. Patients can also get health tips and advice from doctors. Patients can also get to see when their next appointment is and on which date and time.

1.5 URL

The most suitable URL for this website would be: *www.indopacmedical.com.fj* The use of .com URL is a very common and easy to remember URL and the users can remember it easily. This also signifies that the health care is in Fiji. The ".com" shows that the health care operates as a commercial service as it is a private health clinic.

2.0 Content Goals

The goal of IndoPacific Health Care is to serve as a website that facilitates the booking of medical appointments by providing patients and healthcare professionals in Fiji some flexible scheduling options.

2.1 Justification

Web-based services save healthcare costs while enhancing patient safety, increasing patient engagement in healthcare decision-making, facilitating patient-provider communication, and improving efficiency. Examples of Web-based projects go beyond electronic medical records and include online healthcare portals, e-prescriptions, e-scheduling, and Web-based messaging systems similar to live chat and email. Medicare and other insurance companies have provided incentives to encourage the use of health information technology, but they still required a widely accepted payment model and an outcome measure (SA, 2011).

3.0 Audience

3.1 Gender

Services are provided to all as medical services are not gender biased. Every people in this world has the right to health assistance and services.

3.2 Age Group

Services are provided to all age groups ranging from new born to elderly people. Children from the age of 0 – 12 will be given the service of routine checkups and vaccinations. The parents of the new born will be the one who will usually make appointment for vaccinations and regular checkups. Teenagers (13 - 19) and Adults (20 - 59) will be given a range of services which include general checkup, maternity clinics, blood tests, consultations and other important treatments. Elderly people from the ages 60 and above usually need frequent appointments since their health deteriorates during these age. The elderly people will be given advanced treatments for NCD's and other diseases. They will also be given general checkups too.

3.3 Nationality

This website can be accessible by the local people of Fiji which will make it convenient for them to get access to health services. This website will also be available for tourists who come to Fiji for their vacation. This will help the tourists since an appointment is much better than waiting for the doctor for hours in line which will waste their time. The Indo – Pacific Healthcare will not consider nationality an important factor in giving medical care.

4.0 Site Content and Functional Requirement

4.1 Online Booking

After implementing Web-based scheduling, the majority of the practices saw improvements in a number of evidence, including a lower no-show rate, less staff work, shorter waiting times, more customer satisfaction, and so forth. A number of factors, including cost, flexibility, safety, and integrity, discourage providers from converting to web-based scheduling. Patients' inability to use Web-based appointment booking is mostly driven by their communication preferences and past computer and Internet usage experiences (Peng Zhao, 2017)

4.2 Doctor Profiles

The doctor profile pages on your medical website are frequently the most popular sites on your website. It is crucial that you get them correct. A doctor profile page should do is make your visitors feel impressed and certain that they are in good hands (Doctors Profile Page for Medical Websites).

4.3 Customer Reviews

Technological innovations such as electronic health records (EHR) and the Internet are transforming healthcare. Patients can now take a more active role in their own medical healthcare. Although it's not particularly common, patients can view their medical records electronically in several nations. Patients can access their health information online through patient portals, which are websites that are connected to healthcare providers. These portals are beginning to be used, but their precise potential to enhance patient care is still unclear (Elske Ammenwerth, 2012).

4.4 Health Tips and blogs

A medical clinic blog provides up-to-date, reliable information written by certified healthcare professionals, giving readers advice on how to prevent illness and adopt healthy behaviors so they may take charge of their own health. It speaks to issues that are specific to the area and encourages communication between readers and the clinic for accessible, informal advice (5 benefits of healthcare blogging, 2022).

Although a medical clinic blog might offer valuable information, it's important to be aware of its limitations. It won't solve every health issue and shouldn't take the place of expert medical guidance. Blog entries are unable to diagnose illnesses or offer individualized treatment regimens. It's important to avoid false information on the internet and see a doctor if you have any specific queries or concerns (Exploring the Pros and Cons of Wellness Programs, 2023).

4.5 Search Feature

"Site search is the functionality that enables users to search a given website's content or product catalogs with speed and relevance" (Ormazabal, 2023). When a website offers a quick and efficient search feature, users may quickly find what they're looking for without having to waste time browsing the entire site. This improves the user experience by making navigation easier and making it quicker to locate specific content. Since relevant information is readily accessible, users are more likely to interact and explore the website for a longer period.

5.0 Site Structure

For the Indo Pacific Health Care, a web structure would be the most suitable structure since it encourages high rate of user experience. Users like to see a properly structured website. Easy navigation also improves user experience.

5.1 Site Storyboard

I. Homepage

The homepage includes the logo of the Indo Pacific Health Care which will be on the top left of the page.

It includes navigation on the top right which includes services offered, reviews, blogs, FAQs and about.

II. Services Offered

This is a very important part of the website since this will include all the services that are offered by the health care.

Booking Appointment - This is the main feature of the website since this will allow the patients to book an appointment for themselves.

III. Customer Reviews

Customer reviews will provide a picture to other people how the Health Care performs while giving service. Patients are always sceptical in choosing private health care. The customer reviews will give them a picture of how good this health care is and will also answer their question of patient satisfaction.

IV. Blog And Health Tips
This website will include weekly tips given by the doctors on how to live a healthy lifestyle. This can be seen as an interesting feature since this will catch the interest of the patients and will allow them to visit the site almost every week.

V. FAQs
This section will serve to clear the doubts of the patients regarding the Indo Pacific Health Care. Simple questions such as the opening hours to the policies of the health care will be answered in this section.

VI. About Us
This section of the site will include the mission and vision of the site. It will also include vital information about the website.
This will provide the location where the Health Care is located.
This will also include the contact details of the health care.

6.0 Site Navigation

6.1 Where Am I?

The user's current location will be displayed through breadcrumbs and clear page headers.

6.2 Where Can I Go?

Access to any section of the website will be possible through a simple navigation bar with drop-down menus.

6.3 How Do I get there?

Users will be directed to pertinent pages via internal links found in associated sections and content.

6.4 How do I get back to where I started?

Users will find it simple to get back to the homepage with a standard navigation bar and "Home" button.

7.0 Layout of the Website

7.1 Page Layouts

All the pages mainly consist of the header, which contains the firms name, logo and the main navigation menu. The body of the page which holds whatever information is relevant to the specific webpage in use. The footer is the final part of the webpage which mainly consists of copyright information

7.2 Active and Passive White Spaces

Active white space refers to the intentionally blank areas used to draw attention to specific elements or to provide visual relief. For example, in our website, the space around the logo and navigation

bar in the header can be considered as active white space. Passive white space is the blank space used to separating different sections or elements, hence providing a sense of clarity as well as organization. For example, the space left between the navigation link and the content areas can be considered as passive white space.

7.3 Implementing Unified Design

Unified design simply is a design where the layout, images, shapes and typography work together as a whole and are well integrated. Unified Design in our website is implemented by ensuring that there is consistent color schemes and design elements across all the pages to ensure a cohesive looking website. The layout of the webpages are standardized in order to remain consistent to maintain a unified user experience. The Navigation of the website is kept uniform across all pages to allow of easy navigation of the user regardless of on which webpage they are on. The final measure to ensure that Unified Design is implemented was to incorporate repeated design elements such as headers and footers to ensure consistency.

7.4 Implementing Smooth transitions

Smooth transitions simply means to ensure that when a user goes from one webpage to another, their transition is seamless hence making the website as user friendly as possible. This is implemented in our website using responsive design features which ensure consistent performance and usability across platforms. CSS is used in our website to make the website appealing to the user as well as to enhance the usability of the website.

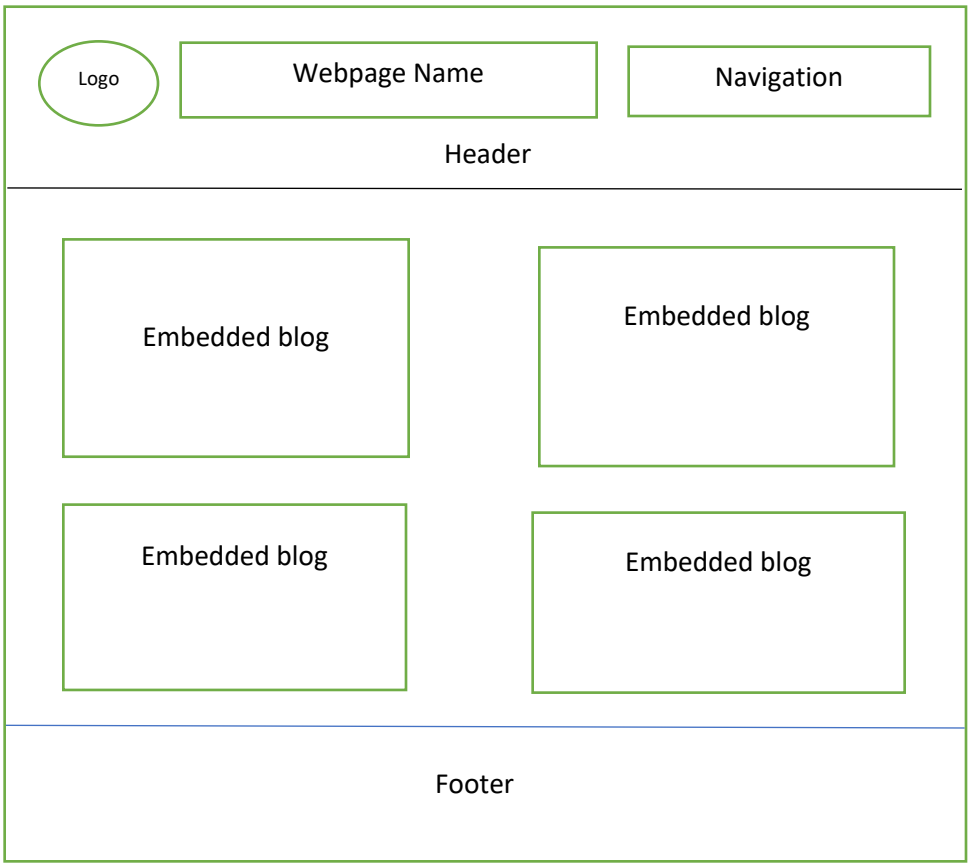
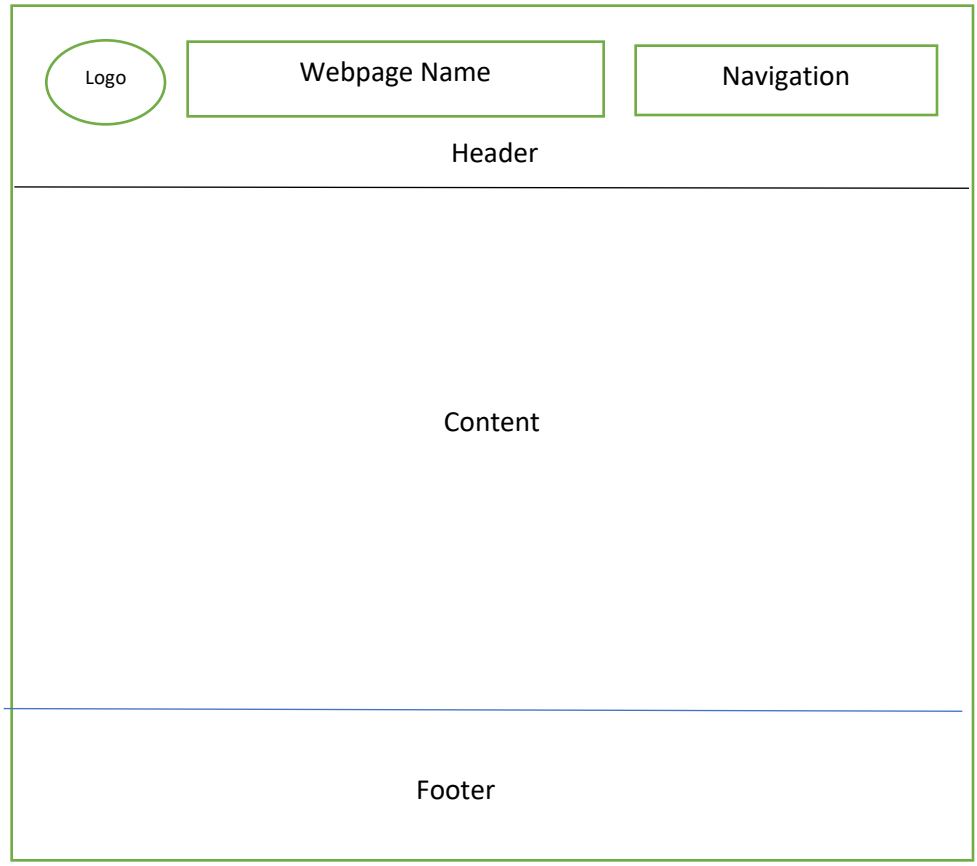
IV. Blogs



V. FAQs

VI. About



8.0 Accessibility

Websites are crucial platforms for distributing information, communicating, and interacting. Nevertheless, for websites to be truly inclusive spaces, they need to be created with accessibility as a primary consideration. Making websites that are usable for all users, regardless of abilities or devices, is what is known as web design accessibility (Shawn Lawton Henry., 7 March 2024)

8.1 IT Accessibility

I. Responsive Design For Cross Device Compatibility

It is important that everyone can easily use the website. A Users interact with websites through devices such, as computers, laptops, tablets and smartphones. Therefore, the design should be flexible to accommodate screen sizes and resolutions for better view and smooth interaction. Responsive design ensures that users can navigate the website smoothly across all devices for smooth transition.

II. Optimizing for Mobile Devices and Touch-Friendly Design Elements

Optimizing for mobile is important as more users are browsing on their phones since it is a commonly used device nowadays. Enhancing site accessibility for smartphone and tablet

users involves designing with touch-friendly elements and optimizing loading times for mobile networks.

III. Keyboard Accessibility for Users with Mobility Impairments
Considering keyboard accessibility is crucial, especially for individuals with mobility impairments who depend on using keyboards for navigation. Making sure that all interactive features can be accessed using a keyboard and displaying clear focus indicators improves usability for these individuals.

IV. Screen Reader Compatibility and Semantic HTML Tags
Screen reader compatibility is crucial for users with visual impairments. Using semantic HTML tags, provides a descriptive text for images, and correctly labelling it helps to ensure a content is accessible and understandable by all users, especially those who are using screen readers.

8.2 Audience Accessibility

I. Considerations for Color and Contrast for Users with Visual Impairments
Considering colour and contrast is crucial for users who have visual impairments or colour blindness. Creating a design with strong contrast between text and background colours enables a user not solely relying on colour for conveying information but improves readability and understanding of a user.

II. Providing Alternative Text for Non-Text Content and User Testing for Accessibility Evaluation
In addition, offering images for non-text content, guarantees accessibility for users with disabilities. A User testing is important for evaluating and enhancing a website's accessibility. Performing usability tests with users who have different disabilities and various devices can reveal accessibility challenges which guide ongoing improvements to the design of the website.

III. Incorporating Feedback from Users with Disabilities
Feedback from users with disabilities is particularly valuable in ensuring that the website meets their needs and provides a better user experience.

9.0 Domain Name Registration and Hosting costs

The result presents a thorough examination of these procedures, explaining the complexities along with associated cost. After some research our group choose infinityfree as a hosting service at it provides a free hosting of the website and there is an option to upgrade the hosting plans.

Firstly, users have to signup to infinityfree by entering email address and setting up a password. After signing up, create a new hosting account by deciding on a domain registrar, the registrant searches for a domain name that best represents the brand. This entails searching through a large database of already-registered domain names using the registrar's search feature. The domain availability, prospective premium status, and the selected TLD are some of the factors that affect the choosing process.

The price of registering a domain varies according to a number of criteria. .com and.net are prevalent TLDs that make up standard domain names, which usually have reasonable yearly prices of $10 to $200. On the

other hand, more expensive domain names or uncommon Top-Level Domains (TLDs) might fetch hundreds or even thousands of dollars. Moreover, registrants need to think about how long they want to stay registered. There are options that range from one to ten years, and each has a cost associated with it.

After securing the name, focus turns to hosting, where the files and data for the website are housed virtually. From virtual private servers (VPS) and dedicated hosting to shared hosting There are other aspects to take into account besides price when choosing a hosting company. For a hosting experience to be flawless, dependability, performance, security features, customer support, and scalability are essential. Providers with a strong infrastructure, prompt assistance, and an easy-to-use interface enable website owners to confidently traverse the intricacies of web hosting.

InfinityFree provides 5 GB Disk Space, Unlimited Bandwidth,PHP 8.2,MySQL 5.7 / MariaDB 10.4,Free Subdomain Names,Bring Your Own Domain,400 MySQL Databases,Free DNS Service,Free SSL Certificates,Full .htaccess Support.

Additionally, the pros of InfinityFree are that it is Free forever web hosting with Free forever web hosting which has cPanel for website management and Excellent knowledge base and forum but the cons of it is that it has no email or phone support.

To sum up, domain name registration and hosting are essential components of the online environment that support the creation and maintenance of websites on the internet. Thorough research and wise decision-making enable people and businesses to start their online journeys with conviction and clarity, paving the way for digital success, even though the expenses involved in these procedures may differ.
